THIN SECTION PREPARATION

1.0 PURPOSE

The purpose of this procedure is to document the process for the preparation of thin sections from rock samples. Thin sections are used for geological analysis on the microprobe, various microscopes, and for other geological analysis.

2.0 SCOPE

2.1 Applicability

This procedure covers any geologic thin sections prepared in Earth and Environmental Sciences (EES) Division for the Environmental Restoration program, and it is applicable to all personnel who prepare these sections.

2.2 Training

Any person producing thin sections must receive on-the-job training and must be skilled enough to produce thin sections that are acceptable for the intended use.

3.0 DEFINITIONS

- A. Thin sections: For the purpose of this procedure, the term thin section will refer to standard petrographic thin sections, as well as grain mounts and fluid inclusion slides.

4.0 BACKGROUND AND/OR CAUTIONS

Preparation of thin sections requires a fine level of skill which cannot be completely described. Also, even a competent preparer may not always produce useable results. Therefore, the final determination of the quality of a thin section must be made by the requestor who decides if the thin section is suitable for the end use.

Of critical importance to this procedure is the accurate transference of sample identification to the thin sections. Samples are to be locked up during non-working hours. Also, all samples must be in locked storage when they are not being used. After thin sections are produced, the thin sections and all remaining sample material are to be returned to the requestor.

Be sure to refer to the appropriate Material Safety Data Sheet (MSDS) when working with the chemicals listed in Section 5.0, Equipment.

5.0 EQUIPMENT

See Attachment A, Equipment and Supplies Checklist, for a list of equipment required for this procedure.

6.0 PROCEDURE

- A. The requestor submits samples for thin section preparation by completing the thin section request form (Attachment B). The request is entered into the thin-section laboratory log book.
- B. Set samples (pre-numbered in ink) on the table in rows. Mark the sample number in an aluminum dish and on a bag. Use extreme care to mark the sample ID correctly. Set the bag under the rock and place the aluminum dish upside down on top of the rock. Do this for every rock sitting on the table.
- C. At this point it must be decided if the sample needs to be impregnated to aid in its slabbing. This is a subjective decision made by the technician. If not, go on to D.
 - 1. If the sample needs to be stabilized by impregnation, place it on top of a cookie sheet covered with aluminum foil.
 - 2. Paint the surface of the rock completely with epon 815-diethylene triamine. Make sure the sample ID is still clearly legible. If not, write the ID in lead pencil on a piece of paper and attach the paper to the epoxy surface.
 - 3. Allow the epoxy to cure before proceeding (24 hours at room temperature, 30-45 minutes in the oven).
- D. Use appropriate slabbing saw to cut a slab 3/8 to 1/2 in. thick. Set the slab on top of the corresponding aluminum dish and put the excess material in the bag that has been pre-numbered. At this point, refer to the worksheet to determine whether to core each sample with the diamond core or cut them to chip size with the diamond saw. Use a round or rectangular slide to find the best area on the sample for the thin section. Trace around the pattern with a marking pen. Thin-sections are prepared in accordance with commonly accepted practices, such as those described in the reference.

7.0 REFERENCES

Logitech Machine System's Technology Manual for Thin Rock Section Production, 20 pp.

8.0 RECORDS

The records produced by this procedure are completed Thin Section Request Forms and entries into the Thin Section Laboratory Logbook.

9.0 ATTACHMENTS

- A. Equipment and Supplies Checklist for Preparation of Thin Sections**
- B. Thin Section Request Form.**

EQUIPMENT AND SUPPLIES CHECKLIST FOR PREPARATION OF THIN SECTIONS

Small supplies:

- _____ Aluminum dishes
- _____ Sample bags
- _____ Cookie sheet
- _____ Aluminum foil
- _____ Round or rectangular slides
- _____ Indelible marking pen
- _____ Typewriter correction fluid
- _____ Lead pencil with eraser
- _____ 12" Forceps
- _____ One 40-ml beaker, two 600-ml beakers, and
two 150-ml beakers
- _____ Pliers
- _____ Glass stir rod
- _____ Clean wipes
- _____ Tongs
- _____ Dial-caliper
- _____ Probe or pick
- _____ Razor blade
- _____ Large tweezers
- _____ "600" Glass plate
- _____ Staining dish

**EQUIPMENT AND SUPPLIES CHECKLIST FOR
THIN SECTION PREPARATION (Continued)**

- _____ Rubber suction cup bent at 90 degree angle
- _____ Back drop mounting plate
- _____ Microscope cover glass (or cover slips)
- _____ 1-inch round ring mold.

Large Equipment:

- _____ Slabbing saw
- _____ 8" or 10" diamond saw
- _____ Diamond core drill press
- _____ Oven
- _____ Vacuum Chamber
- _____ High- and low-speed lap with 100 mesh plate
and 1, 3, 6, 30, 40, and 45 micron plates
- _____ Hot plate
- _____ Logitech (LP 30) with 1/4-inch rubber and 1-
inch thick piece of foam
- _____ Dial-o-gram balance with dispo weigh boat
- _____ Ultrasonic cleaner
- _____ Air blower
- _____ Electric engraver
- _____ Ingram thin-section cutoff saw
- _____ Ingram grinder
- _____ Petrographic microscope
- _____ Dust chaser.

**EQUIPMENT AND SUPPLIES CHECKLIST FOR
THIN SECTION PREPARATION (Concluded)**

Chemicals:

- _____ Epon 815-diethylene triamine
- _____ Shell epoxy
- _____ Buehler epoxy
- _____ Aluminum oxide (1200 grit)
- _____ Kerosene
- _____ Pella oil
- _____ Silicone carbide (600 grit)
- _____ Isopropyl or ethyl 190 alcohol
- _____ Distilled water
- _____ Sodium-cobaltinitrite powder
- _____ Isopropanol
- _____ Hydrofluoric acid
- _____ Tap water
- _____ Barium chloride
- _____ Methanol (MeOH)
- _____ Amaranth powder
- _____ Diamond paste (1, 3, and 6 micron)
- _____ 6 micron diamond spray
- _____ Diamond Polishing Extender (mixture of propylene glycol and isopropanol)
- _____ Duro Super Glue.
